The chemical formula for ethylene glycol is $C_2H_6O_2$, and its molecular weight is 62.07 g/mol. (4) Ethylene glycol occurs as a clear, slightly viscous liquid that is completely miscible with water. (1,4,5) Ethylene glycol is odorless. (3) The vapor pressure for ethylene glycol is 0.06 mm Hg at 20 ° C, and its log octanol/water partition

CEH: Ethylene Glycols. Apr 2020. Over the last decade, new monoethylene glycol (MEG) capacities have started up in cost-advantaged regions (Middle East) or where demand has been booming (Northeast Asia), while other regions have rationalized their MEG capacity (Europe and Japan). In the Middle East, the abundance of competitively priced ethane has provided a significant cost advantage for regional ethylene and ethylene derivative manufacturers, creating the foundation for the most ...

Traditionally, ethylene glycol production depends heavily on crude oil. But coal-based
ethylene glycol production costs about 16% less than the oil-to-ethylene glycol process. This
made the industry appear promising for China because of abundant coal reserves and low
coal prices. However, when crude prices fell below \$50 a barrel in recent ...

Launched in 1950, the IHS Chemical Economics Handbook (CEH) is the world ' s leading
chemical business research service. Offering information on over 300 chemicals and chemical
markets, it can help you better understand both the global chemical industry and specific
market environments.

Ethylene glycol is produced from ethylene (ethene), via the intermediate ethylene oxide.
Ethylene oxide reacts with water to produce ethylene glycol according to the chemical
equation: $C_2H_4O + H_2O \rightarrow HO-CH_2-CH_2-OH$. This reaction can be catalyzed by
either acids or bases, or can occur at neutral pH under elevated temperatures. The highest
yields of ethylene glycol occur at acidic or neutral pH with a large excess of water.

Ethylene glycol is a clear, sweet, slightly viscous liquid that boils at 198 ° C (388.4 ° F). Its
most common use is as an automotive antifreeze. A 1:1 solution of ethylene glycol and water
boils at 129 ° C (264.2 ° F) and freezes at - 37 ° C (- 34.6 ° F), serving as an excellent
coolant in automotive radiators. Ethylene glycol is highly poisonous; animals or humans that
drink the solution become very ill and may die.

Ethylene glycol has a sweet taste and is often accidentally or intentionally ingested. Ethylene glycol is chemically broken down in the body into toxic compounds. It and its toxic byproducts first affect the central nervous system (CNS), then the heart, and finally the kidneys. Ingestion of sufficient amounts can be fatal.

Ethylene glycol is a clear, colorless syrupy liquid. The primary hazard is the threat to the environment. Immediate steps should be taken to limit its spread to the environment. Since it is a liquid it can easily penetrate the soil and contaminate groundwater and nearby streams.

Product Overview Diethylene glycol butyl ether (DGBE) is a type of glycol ether. It is primarily used as a solvent in coatings, inks, cleaners and specialty fluids, or to produce diethylene glycol butyl acetate.¹ It evaporates slowly and is completely water soluble.² Dow sells DGBE under the trade name Butyl CARBITOL™ solvent.
